Q & T FOODS LTD

Business workspace

TRAINING & ADOPTION GUIDE

ERP Roles, Permissions & User Manual

A practical, plain-language guide for every user—with detailed Operations and Finance workflows, hand-offs, and real screen examples.

5 standard roles

69 business screens

Role-based access

Operations + Finance focus

UAT / training edition · 15 September 2026 · Version 1.0

Operations

Buy, receive, store, plan, make, check, pack and dispatch.

Finance

Approve, match, pay, post, reconcile, report and control.

Sales & partners

Sell, deliver, resolve claims and exchange entitled records.

Administration

Manage users, roles, workplaces, controls and audit evidence.

Welcome to the ERP

This manual explains what each role can see, what each role can do, and where work passes from one team to another.

The ERP is designed around job responsibility. Your menu is intentionally different from another user’s menu. Seeing fewer screens is a security feature—not missing functionality.

Simple rule

Your access is the combination of your active role, selected company and plant, action permissions, and the current status of the record.

How to use this guide

- ✓ New users: read pages 3–5, then go to your role section.
- ✓ Operations: use sections 4–6 for daily work and Finance hand-offs.
- ✓ Finance: use sections 7–9 for approvals, posting, reconciliation and review.
- ✓ Administrators: use sections 12–14 before creating users or custom roles.
- ✓ Auditors and managers: use the complete access and action appendices.

Training screenshots

The pictures were captured from the local seeded training environment. Counts and records will differ in UAT or production, but access behavior and screen layout are the same.

Contents

01	First-day basics Sign in, choose a workplace, navigate and secure the account	02	How access works Roles, screens, actions, scope and workflow controls
03	Role overview Compare all five standard roles	04	Operations Manager Procurement, stock, production, quality and logistics
05	Finance Manager Approvals, payables, accounting and controls	06	Operations ↔ Finance Shared workflows and separation of duties
07	Sales & Partner Commercial work and external tenant access	08	ERP Administrator Users, roles, permissions and control setup
09	Screen access matrix All 69 business screens by role	10	Action permissions Friendly action catalogue by role
11	Help & adoption Troubleshooting, glossary and first-week checklist		

Every protected task begins with a named account and an authorised company/plant selection.

The screenshot displays the 'Choose where you are working' interface for the Q & T Foods LTD Business workspace. At the top, the header shows the company name and a 'Sign out' button. Below the header, the main heading 'Choose where you are working' is prominently displayed. A sub-header 'CHOOSE YOUR WORKSPACE' is visible above the heading. A message states: 'You will only see the work assigned to your role for the company and plant you choose.' Below this, the user's role is shown as 'Demo ERP Administrator' with a 'DE' icon. Two workspace options are presented in white cards with rounded corners. The first card, 'Training Plant', is for 'Q & T FOODS LTD' and includes a link 'Open workspace →'. The second card, 'Finance Review', is for 'Q & T FOODS LTD' and also includes a link 'Open workspace →'. Both cards are marked as 'AVAILABLE' in the top right corner. The interface is clean and modern, using a light blue and white color scheme.

Why the workplace matters

Stock, transactions, approvals and reports are filtered to the selected company and plant.

Changing workplace

Select the company/plant control in the top bar. Finish or save any draft before switching.

Account safety

Never share an account. Open *My account* to set up two-step verification, review recovery codes and revoke an unfamiliar device session.

Why two people see different things

The system applies several controls together. A visible button is not the only security boundary; the API repeats every check.

1 • IDENTITY

Named account

The user must be active, verified where required, and signed in.

2 • ASSIGNMENT

Company + plant

An active, in-date role assignment is required for the selected workplace.

3 • SCREEN

Can I open it?

Screen access decides whether the item appears in the menu and whether its API can be read.

4 • ACTION

Can I change it?

Actions such as Create, Approve, Post, Pay or Close require their own permission.

5 • WORKFLOW

Is it valid now?

Status, value bands, maker-checker rules, version and data checks can still block the action.

View does not mean edit

A Finance Manager can view Production Costs but cannot calculate them. An Operations Manager can view Maintenance and create work; Finance can complete the accounting hand-off.

Multiple roles combine

If a user has two valid assignments in the same workplace, their effective permissions are combined. Use this sparingly and review the resulting segregation of duties.

Partner access is narrower

A Partner User needs both the Partner role and explicit tenant entitlements. They never inherit internal approvals.

When access is working correctly

- ✓ The sidebar contains only assigned business screens.
- ✓ Unauthorised direct links return the user to safe work.
- ✓ Protected APIs return “forbidden” even if someone constructs a request manually.
- ✓ Buttons appear only for valid permissions and record states.

When to contact an administrator

- Your company or plant is missing.
- Your role has expired or is inactive.
- A required screen is absent for an approved job duty.
- A colleague left and their assignments or sessions must be revoked.

Standard roles at a glance

Counts below are the current seeded baseline. Custom roles may contain a smaller, approved combination.

SALES MANAGER

13

SCREENS · 38 ACTIONS

Owns enquiries, pricing, sales orders, dispatch, claims and customer collection work.

OPERATIONS MANAGER

42

SCREENS · 142 ACTIONS

Owns procurement execution, inventory, planning, production, quality, packing and logistics.

FINANCE MANAGER

24

SCREENS · 75 ACTIONS

Owns approval, payables, receivables, accounting, payroll, reporting and finance controls.

ERP ADMINISTRATOR

69

SCREENS · 272 ACTIONS

Configures the organisation, users, roles, policies and integrations; supports all workflows.

PARTNER USER

1

SCREEN · 4 ACTIONS

Reads only entitled commercial records and exchanges documents or claims in one party tenant.

ROLE	PRIMARY RESPONSIBILITY	IMPORTANT BOUNDARIES	TYPICAL HAND-OFF
Sales Manager	Customer opportunity through delivery, claims and collections.	No administration, procurement, production or general-ledger access.	Confirmed demand to Operations; credit/financial exceptions to Finance.
Operations Manager	Materials and physical flow from supplier through factory and dispatch.	No user/role administration, sales-order creation, payables payment or general-ledger posting.	Approved purchasing evidence and completed physical movements to Finance.
Finance Manager	Commercial approval and financial recognition, payment, reconciliation and reporting.	No user/role administration, production execution or sales-order creation.	Approval or posting result back to Operations and Sales.
ERP Administrator	Secure platform and business-control configuration.	Permission does not bypass maker-checker, workflow status, scope or data validation.	Enable users and controls; investigate access or integration issues.
Partner User	Self-service access for one explicitly entitled customer/partner tenant.	No internal menu or approval; cannot see another party's records.	Claims/documents to the internal owner; receipt acknowledgement only.

Least privilege

Do not give ERP Administrator merely to solve a missing menu item. Correct the workplace assignment or create a focused custom role.

VISUAL ROLE COMPARISON

Operations and Finance start differently

The same “My work” design is used, while each sidebar contains only the screens assigned to that role.

Finance Manager · 24 screens

Approvals, accounts, reports, finance/people and review tools dominate the menu.

Operations does not see

Roles & access, user administration, Sales Orders, General Ledger or supplier payment actions.

Finance does not see

Roles & access, user administration, Sales Orders, stock operations or production execution.

Your role: control physical operations

Operations has broad factory and supply-chain access, but it does not include finance posting, sales-order ownership or security administration.

What you own

- ✓ Supplier sourcing, orders, arrivals, receipt and rejected returns.
- ✓ Stock ownership, lots, reservations, issues, transfers, counts and disposal.
- ✓ Demand, material requirements, capacity schedules and production orders.
- ✓ Production stages, yield/loss/rework, lab checks and food-safety controls.
- ✓ Artwork, packing, finished goods, traceability, recalls and batch cost calculation.
- ✓ Picking, loading, delivery confirmation, physical returns and maintenance work.

Your strongest control

Record the physical event when it happens. Accurate lot, quantity, location and status data is what Finance later relies on.

Your 42 screens

Home

My work · Help & support

Purchasing & inventory

Customers & suppliers · Brands & agreements · Items & units · Products & packs · Purchase requisitions · Supplier quotations · Purchase orders · Supplier arrivals · Goods receipts · Incoming quality checks · Supplier returns · Stock overview · Stock issues & returns · Stock transfers · Stock counts · Expiry & disposal

Production & quality

Recipes & materials · Production steps · Quality standards · Demand planning · Material planning · Production schedule · Production orders · Production stages · Yield, loss & rework · Lab testing · Food safety · Labels & coding · Packing · Finished goods · Traceability & recalls · Production costs

Delivery and shared work

Order picking · Loading & dispatch · Delivery confirmation · Returns & claims · Unsold returns · Equipment maintenance · Multi-plant operations · Planning recommendations

What you do not receive

User/role administration, approval-policy setup, customer sales-order creation, supplier payment, general-ledger posting, payroll posting, finance imports or financial-report execution. Send those tasks to the authorised owner.

A dependable daily routine

Use “My work” as the starting point; use registers to investigate and complete the underlying record.

1

Confirm the workplace

Check the company, plant and “Operations Manager” label in the top bar before entering any quantity or making a status change.

2

Review My work

Check open, assigned, pending and overdue items. Claim work when ownership is required; open the source record before deciding.

3

Clear physical exceptions first

Prioritise held stock, incoming-quality decisions, shortages, production holds, overdue stages, loading problems and safety alerts.

4

Process planned work

Continue approved purchasing, stock movements, released schedules, production, quality and dispatch in their expected sequence.

5

Complete evidence

Use meaningful reasons, references and attachments. Never use a status change merely to remove an item from the queue.

6

Hand off and reconcile

Confirm that posted quantities and completed records are visible to Finance. Escalate discrepancies instead of creating compensating data.

Before selecting Post, Release, Complete or Dispatch

Recheck the selected plant, lot, owner, location, quantity, unit, effective recipe/route, reason and supporting reference. These actions create accountable history and may affect stock or downstream finance.

MORNING

Queue + exceptions

Overdue, quality hold, shortage and failed movement.

DURING SHIFT

Record at source

Receipt, issue, stage, test, pack and dispatch promptly.

BEFORE CLOSE

Reconcile

Open movements, partial receipts, active stages and hand-offs.

Purchase-to-receipt workflow

Operations creates and executes the request; Finance independently approves the requisition and later owns invoice/payment controls.

Operations checklist

- ✓ Use the correct supplier, item, quantity and unit.
- ✓ Do not source an unapproved requisition.
- ✓ Capture all quote terms before award.
- ✓ Receive only against an issued purchase order.
- ✓ Record lot and held location accurately.
- ✓ Return only rejected, available stock to the supplier.

Stop and investigate when

- Estimate, quote and order do not agree.
- Received quantity exceeds remaining order quantity.
- The lot, owner or unit is unclear.
- Accepted plus rejected does not equal inspected quantity.
- A version conflict says someone changed the record.
- Finance reports a match exception.

SCREEN	OPERATIONS ACTIONS	RESULT / NEXT OWNER
Purchase requisitions	Create, edit, submit, cancel	Finance approval queue
Supplier quotations	Create, edit, issue, record quotes, award, cancel	Awarded source for purchase order
Purchase orders	Create, amend, issue, cancel	Issued commitment for arrival/receipt
Supplier arrivals / Goods receipts	Create, update, post or cancel	Received lot in Quality Hold
Incoming quality / Supplier returns	Complete inspection; create/update/post/cancel rejected return	Released stock or controlled supplier return; accepted receipt available to Finance

VISUAL WALKTHROUGH

Same requisition, different responsibility

The interface exposes actions by role. The same screen can therefore support a controlled hand-off.

Q & T FOODS LTD

Training Plant - Operations Manager

My account · 2 step left · ?

Purchase Requisitions

Versioned material requests with scoped item costing, policy-routed approval, maker-checker decisions, and immutable control evidence.

Governed requisition workflow

Drafts remain editable until submission. Approval authority is resolved from the plant policy and the maker cannot decide their own request.

REQUISITION

PURPOSE

STATUS

No requisitions match the current filters.

Previous · Page 1 of 1 · Next

Requisition detail

Select a row or create a controlled request.

Choose a requisition to inspect its lines and approval evidence.

Finance Manager

No create button. Finance receives only requests matching its direct or delegated approval authority.

Maker

Operations explains the business need and supplies accurate lines and estimated value.

Checker

Finance examines policy, amount, supporting evidence and maker-checker separation before deciding.

A permission is not a promise that a button will always appear.

The request must be in the correct status, within authority, unchanged, and created by another person where maker-checker applies.

Inventory and inbound control

Inventory is a ledger of accountable movements—not a number to overwrite. Always use the operation that describes what physically happened.

Stock overview

Review physical, reserved, blocked and available quantities by item, owner, lot, location, quality and expiry.

Actions: manage owners/lots; reserve and release.

Issues & returns

Use for authorised consumption or return of stock when the movement is not already created by a dedicated workflow.

Actions: create, edit, post, cancel.

Stock transfers

Move stock between controlled plant locations while preserving owner, lot, quality and movement evidence.

Actions: create, edit, post, cancel.

Stock counts

Record the counted quantity and reason. Posting creates the controlled adjustment; it does not rewrite history.

Actions: create, edit, post, cancel.

Expiry & disposal

Identify expiring stock and dispose only through the governed record with reason and outcome location.

Actions: create, edit, post, cancel.

Incoming quality

Split the inspected held quantity into accepted and rejected quantities. The total must reconcile exactly.

Action: complete inspection.

Never correct stock by guessing.

If the wrong item, unit, lot, owner, location or quality status was posted, stop and follow the approved correction/reversal process. Preserve the original audit trail.

Before posting a movement

- ✓ Correct workplace and location
- ✓ Correct item/SKU and unit
- ✓ Correct owner and lot
- ✓ Enough available quantity
- ✓ Reason and source reference entered

After posting

- ✓ Confirm the movement number/status
- ✓ Check resulting stock availability
- ✓ Confirm linked source record
- ✓ Resolve any work-queue exception
- ✓ Notify the next owner when required

Plan and execute production

Planning creates controlled snapshots; execution consumes the released plan and records actual material, time, output and quality.

PLAN

Demand planning

Create time-phased manufactured-product demand and release it.

MATERIALS

Material planning

Run recipe explosion and stock netting; resolve shortages.

CAPACITY

Production schedule

Schedule routes against work-centre capacity; reserve materials.

BATCH

Production order

Create, release and issue the exact reserved material.

ACTUALS

Stages + output

Start/complete in sequence; record good yield, loss and rework.

RELEASE

Quality + packing

Complete tests and holds before packing released output.

Release gates

- ✓ An effective recipe and active production route exist.
- ✓ Material shortages and capacity overloads are resolved.
- ✓ Reserved material is available by lot and expiry.
- ✓ Stages are completed in route order.
- ✓ Good + loss + unresolved rework reconciles to actual output.
- ✓ Required lab results and food-safety holds are clear.

What the system preserves

- Recipe, material and route snapshot used by the order.
- Exact reservations and stock issues.
- Stage timestamps and actual duration.
- Yield, loss, rework and resolution history.
- Specification results, deviations and holds.
- Finished-lot genealogy, coding and cost evidence.

Cancel carefully.

Cancelling a released schedule or order can return reservations, but only while downstream execution allows it. Read the displayed reason when cancellation is blocked.

VISUAL WALKTHROUGH

From released schedule to production order

Both screens belong to Operations, but they represent different control points: commitment of capacity/material and accountable batch execution.

Q & T FOODS LTD
Training Plant - Operations Manager

My account 2 step off ?

Production Schedule

+ New

Load MRP orders onto route work centers, test finite daily capacity, and reserve eligible material by FEFO.

LIVE

Release is atomic: every capacity must fit and every material requirement must be fully reservable at the planned start date.

No production orders match the current filters.

Previous

Page 1 of 1 - 0 records

Next

Production orders

Convert released schedule lines into batches, issue reserved material and complete accountable output.

Schedule answers “when and with what?”
It uses route capacity and FEFO material availability before release.

Order answers “what actually happened?”
It records batch material, stages, quality, yield and completion evidence.

Quality, packing, traceability and cost

These controls make every finished lot explainable from incoming material through release, customer exposure and actual cost.

AREA	WHAT OPERATIONS DOES	KEY RULE	RESULT
Quality standards	Create, edit and lifecycle-manage typed specifications.	Use effective standards with valid limits and test methods.	Controlled acceptance criteria.
Lab testing	Create samples and complete parameter results.	Failed values can create a deviation automatically.	Pass/fail evidence linked to the batch.
Food safety	Create/release holds, resolve deviations and release eligible batches.	No release while blocking quality evidence remains.	Explicit disposition and release history.
Labels & coding	Create/update revisions, approve effective artwork, retire superseded versions.	Packing must use an approved, effective revision.	Traceable product coding.
Packing	Create, complete or cancel packing runs.	Only quality-released output can become finished stock.	Finished lot and stock receipt.
Traceability & recalls	Create and close recall cases; explore genealogy both directions.	Open recalls block connected on-hand stock.	Customer exposure and containment evidence.
Production costs	Calculate immutable material/conversion/yield and variance snapshots.	Calculate only from complete accountable actuals.	Batch cost available to Finance and profitability.

Before batch release

Check completed stages, reconciled output, required tests, deviations, food-safety holds, and approval evidence.

Before packing

Check released batch quantity, product/SKU, approved artwork revision, barcode and rendered lot/date code.

Before cost calculation

Check material issues, stage actuals, good quantity, losses, rework resolution and configured cost inputs.

Finance can view Production Costs but cannot calculate them.

This preserves Operations ownership of production actuals while allowing independent financial review.

Your role: approve and account

Finance sees 24 focused screens. It can review selected operational evidence, but cannot execute production or administer system access.

What you own

- ✓ Purchase-requisition approval within direct/delegated authority.
- ✓ Customer credit controls and receivable collection allocation.
- ✓ Supplier-invoice matching, invoice/proposal approval, payment and bank reconciliation.
- ✓ Expenses, journals, periods, overhead allocation, assets and payroll posting.
- ✓ Financial scenarios, adjustments, historical imports, archive, openings and diagnostics.
- ✓ Controlled reporting, multi-company consolidation and planning-review decisions.

Your strongest control

Do not treat operational completion as financial proof by itself. Match the source, quantities, price, tax, approval and accounting period.

Your 24 screens

Home & review

My work · Help & support · Reports · Purchase requisitions · Production costs

Commercial & returns

Pricing & customer credit · Unsold returns · Customer accounts · Profitability

Finance & people

Supplier invoices & payments · Expenses · General ledger · Overhead costs · Fixed assets · Employees & payroll · Equipment maintenance

Scale & finance tools

Multi-plant operations · Planning recommendations · Financial scenarios · Finance adjustments · Historical data import · Bill archive · Opening balances · Finance review tools

What you do not receive

User/role administration, purchasing execution after requisition approval, physical inventory posting, production execution, quality release, packing, dispatch or sales-order creation. Review their evidence; do not perform their jobs through Finance access.

A dependable daily routine

Start with approvals and exceptions, then move through matching, posting, reconciliation and review.

1

Confirm scope

Verify company, plant and Finance Manager in the top bar. A report or journal in the wrong scope is not a harmless mistake.

2

Review My work

Open approval and exception items from their source. Claim only when ownership is required and leave a decision reason.

3

Resolve matches

Compare invoice lines to purchase order, QC-accepted receipt quantity, price and tax before approving.

4

Post controlled entries

Confirm maker-checker separation, balanced lines, open period, correct accounts and immutable source evidence.

5

Reconcile

Allocate receipts/payments exactly, use unique bank references, and investigate unallocated or unmatched amounts.

6

Review and report

Run controlled reports with an explicit cutoff. Use the stored snapshot/export rather than rebuilding totals manually.

Approval questions

- ✓ Is the request from another user?
- ✓ Is it within direct or delegated authority?
- ✓ Is the purpose complete and supported?
- ✓ Do value, supplier/customer and terms make sense?
- ✓ Is the source version unchanged?
- ✓ Is a rejection reason specific enough to correct?

End-of-day questions

- Any approved but unposted items?
- Any payment or receipt not reconciled?
- Any journal draft or imbalance?
- Any nearing period-close dependency?
- Any failed export or unacknowledged file?
- Any overdue Finance work item?

!

Never approve because the requester is waiting.

If evidence is incomplete, reject or return it with a useful reason. Approval is an accountable control, not a queue-clearing action.

Supplier invoices, proposals and payment

The payable workflow links financial settlement to an issued order and QC-accepted receipt evidence.

Payables and the general ledger

Payables governs supplier settlement; the ledger governs balanced accounting entries and periods.

Status

All statuses

Choose a journals record or start a new governed command.

No live records match the selected context and filters.

General ledger

Create balanced journals, post, reverse and close periods under the applicable controls.

Payables starts from a supplier obligation.
Use the purchase order, accepted receipt, tax and bank evidence.

The ledger records the accounting consequence.
Use balanced accounts, an open period, reasoned references and reversal—not deletion.

Accounting and finance controls

Choose the screen that describes the business event. Each workspace has its own posting and evidence rules.

WORKSPACE	FINANCE CAN	CONTROL TO REMEMBER
Pricing & customer credit	Set controlled credit decision/terms.	Sales owns price-list lifecycle; Finance owns customer credit.
Customer accounts	Record and allocate collections.	Do not over-allocate; preserve transaction history.
Expenses	Create, edit, submit, approve, post, cancel.	Maker-checker and valid tax/account/period.
General ledger	Create/post/reverse journals; close periods.	Balanced debits/credits; reverse instead of deleting.
Overhead costs	Create/update pools and allocate.	Use approved basis and balanced target journal.
Fixed assets	Create/update, activate, depreciate, dispose.	Correct dates, useful life, accounts and net book value.
Employees & payroll	Create/update accounting profiles; create, approve and post payroll.	Immutable run snapshot and independent approval.
Financial scenarios	Create and run simulations.	Simulation is ledger-isolated and never posts live entries.
Finance adjustments	Create, submit, approve, post, cancel.	Balanced maker-checker adjustment with a reason.
Historical data import	Create, map/validate and post batches.	Resolve every mapping and validation exception first.
Bill archive	Upload and download retained documents.	Private access, supported type/size, checksum and retention.
Opening balances	Create, reconcile and post.	Lines and control total must reconcile exactly.
Finance review tools	Create snapshot, diagnose and close a review.	Diagnostics preserve a snapshot; they do not rewrite ledger history.
Reports	Run and export controlled snapshots.	Choose the cutoff and retain checksum/freshness evidence.

Who does what in shared workflows

Shared visibility supports review; it does not erase ownership. The letter in each cell describes the expected responsibility.

D Does the work

A Approves/checks

R Reviews/uses evidence

— No standard role action

PROCESS / CONTROL POINT	OPERATIONS	FINANCE	REQUIRED HAND-OFF EVIDENCE
Purchase requisition preparation	D	R	Purpose, lines, need-by date, estimate and source context.
Purchase requisition decision	—	A	Authority/policy snapshot and reasoned decision.
RFQ, award and purchase order	D	R through source evidence	Supplier quotes, ranking, award reason, order/revisions.
Arrival, receipt and incoming quality	D	R	Issued order, lot, received and accepted/rejected quantities.
Supplier invoice, proposal and payment	R / correct source	D + A by separate users	Three-way match, tax, approval, bank reference and allocation.
Production actuals and batch cost	D	R	Material issues, time, yield/loss and immutable cost snapshot.
Unsold return—physical receipt/disposition	D	R	Customer/shipment/invoice, returned quantity, quality outcome.
Unsold return—approval/loss/financial resolution	R	A / D	Policy decision, loss value, tax and receivable/refund/replacement evidence.
Equipment maintenance	D create/release	D complete cost	Asset, work performed, labour/material/external cost and expense account.
Inter-plant movement	D transfer	D consolidate	Route/mapping, dispatch/receipt, exchange rate and elimination evidence.
Planning recommendation	D prepare	A review	Immutable input checksum, limitations, recommendation and outcome.

Maker-checker is a people control.

Giving one person both roles does not guarantee they may approve their own record; workflow rules still compare the actor who made the record with the actor making the decision.

VISUAL HAND-OFF

Unsold return: physical outcome and finance outcome

Both roles open the same case, but their available commands represent different stages of the lifecycle.

Unsold Sales Return & Loss

Sales initiates an unsold return; physical receipt. Quality disposition and loss recognition remain separate controlled actions.

Scoped reference dataCustomer, shipment, SKU, lot and return-quarantine options come from the selected ERP context.

Return cases0

Eligible invoices0

Eligible shipments2

Quarantine routes0

Create unsold return request

Sales to return request

Your active role can review return cases but cannot create a Sales return request.

LIVE LOOKUP CHAIN

Choose a shipment line

Select the customer and original shipment to resolve the exact shipped SKU and finished-goods lot.

Sales records the expected return only. Stores will confirm the actual receipt into the resolved quarantine position.

Recent unsold return cases

Refresh

No unsold return cases exist in this company and plant yet.

Loss disposition approval inbox

Scoped reviewer queue - maker-checker enforced

PendingRefresh

0

pending requests in this plant

Select an approval request to inspect its submitted disposition.

Finance Manager

Approve within authority, post recognised loss and complete credit/refund/replacement accounting.

Physical truth

Returned quantity and condition must reconcile to the shipment and inventory outcome.

Financial truth

Invoice, net credit, tax and receivable/refund/replacement must reconcile exactly once.

Maintenance: work ownership and cost completion

Shared screen, deliberately different action set.

Finance Manager

Independently approve or reject the unchanged source and stated limitations.

i

Human decision remains mandatory.

Read the source cutoff, checksum, exclusions and limitations. If the source changed after submission, revise and resubmit instead of approving stale advice.

Commercial roles

Sales operates the internal customer workflow; Partner User sees only explicitly entitled records inside one external tenant.

SALES MANAGER

Sales Manager

13 screens · 38 actions

- ✓ Qualify and convert enquiries.
- ✓ Manage price lists; Finance owns credit decisions.
- ✓ Create, confirm, amend or cancel sales orders.
- ✓ Manage contract work, picking, loading, dispatch and delivery.
- ✓ Create/resolve claims and create unsold returns.
- ✓ Allocate customer collections and view profitability.

Does not see: administration, purchasing, production, payables or ledger screens.

PARTNER USER

Partner User

1 screen · 4 actions

- ✓ Read entitled orders, shipments, invoices and claims.
- ✓ Create a claim against an entitled shipment.
- ✓ Upload and download entitled documents.
- ✓ Acknowledge document receipt.

Does not receive: any internal screen, another customer's record, implicit document access or internal approval authority.

SALES

Confirm order

Server applies price, discount, tax and credit controls.

OPERATIONS/SALES

Pick + dispatch

Allocate FEFO lots, issue stock and create receivable evidence.

PARTNER

View entitlement

See only party-bound order, shipment, invoice or document.

PARTNER/SALES

Claim + resolution

Claim exact shipped quantity; internal owner controls outcome.

A partner acknowledgement means “received,” not “approved.”

It never approves an invoice, credit, return or any internal workflow.

Visual Comparison

Internal sales vs external partner

The Partner User receives a deliberately minimal navigation and record-entitlement boundary.

No records are visible in this entitled section.

Partner User

One portal screen; data is limited to the assigned external tenant and explicit entitlements.

Internal authority
Screen and action permissions plus company/plant scope.

External authority
Partner role plus party tenant plus explicit record/document entitlements.

Administer access without weakening controls

Administrator is a configuration and support role. It has broad internal screen/action authority, but workflow and data rules still apply.

Organisation

Create/update companies, plants and plant location hierarchies.

Identity

Invite/create users, update status, manage role assignments, verification and device sessions.

Authority

Create custom roles/permissions and atomically assign a permission set.

Approval control

Version plant policies, value bands, delegation and escalation.

Evidence & integration

Search audit evidence; process, retry or quarantine integration work.

Business support

See all business workspaces, manage help cases and configure partner access.

Protected system definitions

The five seeded roles and system permissions are immutable in the editor. Their names, status and permission composition cannot be casually rewritten. Create a company-scoped custom role for local differences.

Admin is still constrained

Maker-checker, approval authority, record status, selected context, optimistic version, required evidence and accounting/stock rules continue to run.

Never use ERP Administrator as the default role.

Grant it only to named platform/business-control administrators, review it regularly, require two-step verification and keep normal operational work under normal roles.

Users and roles are separate controls

Create the authority definition in Roles & access; assign it to a named user and workplace in Users.

Q & T FOODS LTD

Training Plant - ERP Administrator

My account2-step opt?

Users & Assignments

Invitation-first identity, verified access, revocable devices, and effective-dated roles in the selected plant.

Managed identity lifecycle Expiring hashed links, verified email, MFA state, and revocable logical device sessions are live; raw credentials are never retained.

Code

ROLE_CODE

Name

Description

New permission

Create definition

Permission catalogue

New permission

Roles & access

Create a company-scoped custom role and select its permitted screens/actions.

Role answers "what job?"

A reusable, approved bundle of view and action permissions.

Create or invite a user

Invitation is the preferred route because the person sets their own secret. Direct account creation is intended for controlled local/UAT use.

1

Choose the workplace

Select the company and plant where the assignment must apply. User lists and new assignments are scoped here.

2

Open Users and select + New

Choose **Invite user** for normal onboarding or **Direct account** only under the approved procedure.

3

Enter identity

Use the person's real name and unique work email. Never create a shared "finance" or "stores" identity.

4

Choose the least-privilege role

Select the initial role and optional effective-from/to dates. Confirm the role matches the job, not seniority.

5

Send invitation / create

The user and initial plant assignment are created together. Deliver invitation links only through the approved channel.

6

Verify access

Ask the user to sign in, choose the intended workplace and confirm their menu. Do not ask them to share their password.

7

Add exceptional roles carefully

Open the user and add an additional effective-dated role only with owner approval and segregation-of-duties review.

8

Maintain lifecycle

Deactivate assignments/accounts when duties change; resend/revoke invitations, send verification and revoke device sessions as needed.

!

Changes take effect through the active session context.

After an access change, have the user reselect the workplace or sign out and back in. Verify both the menu and one representative allowed/denied action.

Create a custom role and assign permissions

Use a custom role when a standard role is broader than the approved job. Do not edit a protected system role.

Good custom role
Name: Warehouse Shift Lead
Purpose: Receive, inspect, move and count stock at Training Plant; no purchasing award, production release or finance action.
Design: Only required inventory/inbound screens and their exact commands.

Poor custom role
Name: Manager Access
Purpose: "Needs everything just in case."
Risk: Excess privilege, unclear ownership and conflicting maker/checker abilities.

i

Creating a permission record does not create product functionality.
Prefer existing system permissions. A new custom permission only has an effect when an implemented backend route or workflow explicitly checks that permission.

REVIEW BEFORE ACTIVATION	QUESTION	EVIDENCE
Business ownership	Who approved the job definition?	Named owner and request/reference
Least privilege	Can any screen or action be removed?	Task-to-permission mapping
Segregation	Can the role make and approve/post the same item?	Tested maker/checker cases
Scope	Which company/plant and dates apply?	Assignment record
Validation	Were positive and negative tests run?	Test user/screenshots or sign-off

Permission guardrails

Permissions are powerful, but they are only one layer of the control model.

Screen permission

Allows the menu item and protected read route.
Friendly example: *View General ledger*.

Action permission

Allows a command family. Friendly example: *Post journal*. It does not bypass status or validation.

Assignment

Binds the role to a user, company and plant, optionally for a fixed date window.

Approval authority

Policy/value bands and delegation decide which submitted records a reviewer may decide.

Record entitlement

Partner users need explicit party-bound entitlement in addition to their role.

Workflow rule

Record status, maker identity, current version, quantity/balance and evidence remain server-authoritative.

Recommended access review

- ✓ Monthly: active administrator and Finance assignments.
- ✓ Quarterly: all roles, custom roles and partner entitlements.
- ✓ Immediately: leaver, transfer, suspected compromise or emergency access.
- ✓ Before go-live/change: maker-checker and negative access tests.

Prefer deactivation over deletion

Deactivate an account, assignment, custom role or permission to stop future access while preserving historical attribution and audit evidence.

Protected system definitions cannot be edited or deactivated in the normal editor.

Never rely on a hidden button as security.

The backend must enforce the corresponding screen/action permission. This ERP does so for current routes; new features must follow the same pattern before release.

Home and administration

A check means the standard seeded role can open the screen in an assigned workplace.
Action rights are listed later.

✓ Standard access — No standard access Codes are included only as administrator/audit references.

Sales Manager and Partner User

Actions are written as business verbs. Read access is covered by the screen matrix.

Sales Manager • 38 actions

SCREEN	PERMITTED ACTIONS	BOUNDARY
My work	Claim, complete	Only visible/eligible work.
Enquiries & leads	Create, edit, qualify, convert, close	Conversion follows valid customer/product data.
Pricing & customer credit	Create, edit, activate, retire price lists	Finance owns credit decisions.
Sales orders	Create, edit, confirm, amend, cancel	Server prices/taxes and applies credit/contract controls.
Contract work	Create, release, complete, cancel	Must use valid customer commitments.
Order picking	Allocate, pick, cancel	FEFO and available stock enforced.
Loading & dispatch	Create, load, dispatch, cancel	Dispatch posts stock/receivable evidence.
Delivery confirmation	Complete	Record delivered/failed proof.
Returns & claims	Create, receive, resolve	Limited to exact shipped quantities.
Unsold returns	Create, attach evidence	Operations/Finance own later stages.
Customer accounts	Collect	Allocation cannot exceed open balance.
Help & support	Create, comment, reopen, close own case	Scoped to requester and authorised support.

Partner User • 4 actions

SCREEN	PERMITTED ACTIONS	BOUNDARY
Partner portal	Create claim	Only an entitled shipment and available quantity.
Partner portal	Upload document	Private, allowed file and exact tenant.
Partner portal	Download document	Only explicitly entitled available documents.
Partner portal	Acknowledge receipt	Informational only; never internal approval.

Profitability is view-only for Sales.

The standard Sales role has the screen but no calculation/posting action there.

Partner record visibility is not role-only.

Removing one entitlement must remove that record/document even while the Partner role stays active.

Operations Manager — supply and stock

Part 1 of the Operations action catalogue.

SCREEN / AREA	PERMITTED ACTIONS	PRACTICAL MEANING
My work	Claim, complete	Take ownership and finish eligible non-approval work.
Customers & suppliers	Create, edit, lifecycle	Maintain identity, roles, addresses, tax and terms.
Brands & agreements	Create, edit, lifecycle	Maintain effective party agreements.
Items & units	Create, edit, lifecycle	Maintain catalogue item and controlled UOM conversion.
Products & packs	Create, edit, lifecycle	Maintain stock-bearing products, packs and barcodes.
Purchase requisitions	Create, edit, submit, cancel	Prepare need; Finance decides approval.
Supplier quotations	Create, edit, issue, record quote, award, cancel	Run governed sourcing and evidence-backed award.
Purchase orders	Create, amend, issue, cancel	Control the supplier commitment and revisions.
Supplier arrivals	Create, edit, cancel	Record vehicle/arrival against issued order.
Goods receipts	Create, edit, post, cancel	Receive partial quantities into Quality Hold.
Incoming quality checks	Complete	Split held quantity into accepted/rejected.
Supplier returns	Create, edit, post, cancel	Return only QC-rejected, available stock.
Stock overview	Create/edit/lifecycle owner; create/edit/lifecycle lot; reserve, release	Control owners, lots and reservations.
Stock issues & returns	Create, edit, post, cancel	Post controlled issue/return movement.
Stock transfers	Create, edit, post, cancel	Move stock between controlled locations.
Stock counts	Create, edit, post, cancel	Post a reasoned count adjustment.
Expiry & disposal	Create, edit, post, cancel	Record governed expiry/disposal outcome.

Operations Manager — make, deliver and improve

Part 2 of the Operations action catalogue.

SCREEN / AREA	PERMITTED ACTIONS	PRACTICAL MEANING
Recipes / steps / standards	Create, edit, lifecycle each definition	Maintain effective production and quality master data.
Demand planning	Create, edit, release, cancel	Commit demand into material planning.
Material planning	Run, cancel	Explode recipe and net available inventory.
Production schedule	Create, edit, release, cancel	Commit capacity and reserve FEFO material.
Production orders	Create, release, issue, complete, cancel	Control batch and exact material issue/output.
Production stages	Start, complete	Record route sequence and actual time.
Yield, loss & rework	Record, resolve	Reconcile output and determine rework outcome.
Lab testing	Create, complete	Capture results against effective specification.
Food safety	Place hold, release hold, resolve deviation, release batch	Control corrective action and batch gate.
Labels & coding	Create, edit, approve, retire	Govern effective artwork/coding revision.
Packing	Create, complete, cancel	Pack released output and receive finished stock.
Traceability & recalls	Create, close	Contain connected stock and preserve closure evidence.
Production costs	Calculate	Freeze actual batch cost and variance snapshot.
Picking / loading / delivery	Allocate, pick, cancel; create, load, dispatch, cancel; complete POD	Execute physical fulfilment and proof of delivery.
Returns & claims	Receive	Record physical returned goods; Sales resolves commercial outcome.
Unsold returns	Receive, dispose/accept outcome, attach evidence	Record physical/quality stage before Finance decision.
Equipment maintenance	Create, edit, release, complete, cancel	Plan work and capture accountable cost.
Multi-plant operations	Create, edit, submit, dispatch, receive, cancel transfer	Control physical inter-plant movement.
Planning recommendations	Create, revise, generate, submit, record outcome, complete, cancel	Prepare governed advice; Finance approves/rejects.
Help & support	Create, comment, reopen, close own case	Use role-relevant help and requester-owned support.

Finished Goods is view-only for the standard Operations role.

The finished-lot record is produced by controlled packing; Operations uses it for traceability rather than free-form editing.

Finance Manager — approvals, payables and accounting

Part 1 of the Finance action catalogue.

SCREEN / AREA	PERMITTED ACTIONS	PRACTICAL MEANING
My work	Claim, complete	Own and complete eligible Finance work.
Purchase requisitions	Approve/reject within workflow	Use direct/delegated authority and maker-checker.
Pricing & customer credit	Credit decision	Control customer limit/hold/terms; Sales owns price-list lifecycle.
Customer accounts	Collect	Record and allocate customer receipt.
Supplier invoices	Create, edit, match, approve, cancel	Three-way match and independent approval.
Payment proposals	Create, edit, approve, cancel	One supplier, eligible approved balances, maker-checker.
Payments	Pay, reconcile	Allocate exactly and use a unique bank statement reference.
Bank/statutory	Manage bank, export, acknowledge	Masked bank data and checksummed single-use exports.
Expenses	Create, edit, submit, approve, post, cancel	Tax/account validation and maker-checker posting.
General ledger	Create journal, post, reverse, close period	Balanced lines, open period and immutable reversal trail.
Overhead costs	Create, edit, allocate	Controlled allocation basis and balanced journal.
Fixed assets	Create, edit, activate, depreciate, dispose	Lifecycle-safe carrying value and posting.
Employees & payroll	Create/edit employee profile; create run, approve, post	Immutable run snapshot and independent approval.

Production Costs and Profitability are view-only.

Finance reviews the evidence but the standard role has no batch-cost calculation or profitability mutation action.

Finance Manager — finance tools and shared review

Part 2 of the Finance action catalogue.

SCREEN / AREA	PERMITTED ACTIONS	PRACTICAL MEANING
Financial scenarios	Create, run	Model in a ledger-isolated workspace with zero live posting.
Finance adjustments	Create, submit, approve, post, cancel	Balanced maker-checker correction with reason.
Historical data import	Create, validate, post	Map and resolve staged legacy rows before posting.
Bill archive	Upload, download	Private document, integrity, retention and access checks.
Opening balances	Create, reconcile, post	Reconcile detailed lines to the control total.
Finance review tools	Create, diagnose, close	Preserve diagnostic snapshot without rewriting history.
Equipment maintenance	Complete	Complete captured cost to the configured expense account.
Unsold returns	Approve, post loss, complete finance action, attach evidence	Control approval and exactly one credit/refund/replacement outcome.
Multi-plant operations	Consolidate, finalise consolidation	Balanced exchange-rate/elimination snapshot and independent finalisation.
Planning recommendations	Approve, reject	Review unchanged input, rationale and limitations.
Reports	Run, export	Generate immutable cutoff-bound snapshot and deterministic export.
Help & support	Create, comment, reopen, close own case	Requester-owned cases in the selected workplace.

Finance approval is state-derived.

The system only offers a decision when the record is submitted, in scope, within authority, unchanged and made by an eligible different actor.

ERP Administrator

The standard Administrator has all 69 screen permissions and 272 assigned internal/administrative action permissions. Three external Partner-only commands stay with the Partner User.

Includes all internal role actions

Administrator receives every action listed for Sales, Operations and Finance, plus internal partner-administration and elevated control actions. External claim creation, document upload and receipt acknowledgement remain Partner User commands.

Administration actions

- ✓ Create/update companies and plants.
- ✓ Create/update plant locations.
- ✓ Create/update/invite users; assign roles; manage device sessions.
- ✓ Create/update custom roles and permissions; replace role permission set.
- ✓ Create/update approval rules, delegations and escalations.
- ✓ Open protected audit evidence.
- ✓ Process, retry and quarantine integration work.
- ✓ Manage support cases.

Elevated business controls

- Manage work-queue assignment/escalation.
- High-value and escalated purchase/return approvals.
- Create/manage consolidation groups and transfer routes.
- Approve/accept multi-plant transfer stages.
- Administer partner access grants and published documents.
- Run both Operations and Finance sides of standard workflows where state rules permit.

All permissions does not mean all actions are valid.

An administrator cannot bypass selected scope, maker-checker identity, approval value, record state, optimistic version, stock availability, balance, closed period, evidence or tenant isolation.

ADMIN TASK	USE	DO NOT USE
User needs one missing work screen	Correct assignment or custom least-privilege role	Grant ERP Administrator
System role differs from local duty	Create approved custom role	Try to rewrite protected system definition
Record is blocked by workflow validation	Correct source/status/evidence	Add more permissions to bypass it
Person leaves or changes job	Deactivate assignment/account and revoke sessions	Delete historical identity or share the account

Common issues and safe responses

Start with the simplest scope and state checks before requesting more access.

WHAT YOU SEE	LIKELY REASON	WHAT TO DO
Expected menu item is missing	Wrong workplace, inactive/out-of-date assignment, or role lacks screen access.	Check top-bar workplace; reselect context/sign in; ask admin to review assignment—not to grant Admin.
Screen opens but action button is absent	View-only access, wrong workflow status, no action permission, or maker-checker restriction.	Read status and allowed next step; send to correct owner when appropriate.
"Forbidden"	Backend denied screen/action, scope or tenant.	Do not retry with another record ID. Confirm workplace and contact administrator with screen/time/request ID.
"Version conflict" / record changed	Another user updated the record after you opened it.	Refresh, review the new version, then repeat the decision if still correct.
Post/release/complete is blocked	Required source, balance, quantity, quality, period or evidence gate failed.	Read the validation details and correct the source; never create offsetting fiction.
Partner cannot see a record	Party tenant or explicit entitlement missing/expired.	Internal admin verifies the exact grant and entitlement; do not broaden to another party.
Invitation link fails	Expired, already used or revoked.	Administrator resends, which rotates the one-time token.
Suspicious account/device activity	Possible shared/compromised session.	Change password, enable two-step verification, revoke sessions and notify security owner.

Use Help & support. Search role-relevant guidance first. When opening a case, include the workplace, friendly screen name, record number, action attempted, time, displayed error and safe supporting evidence. Never include a password or recovery code.

Your first week

A short adoption plan for new users and their manager.

New-user checklist

- ✓ Sign in with your named account and choose the correct workplace.
- ✓ Confirm your role label and expected sidebar sections.
- ✓ Open My work and practise search/filter/drill-through.
- ✓ Open one register relevant to your job and identify status/version.
- ✓ Practise one draft action in training; review validation before saving.
- ✓ Observe one approval or cross-team hand-off.
- ✓ Learn the correction/cancellation path for your highest-risk action.
- ✓ Enable two-step verification and store recovery codes safely.
- ✓ Open Help & support and know how to submit a useful case.

Manager sign-off

CHECK	EVIDENCE	DONE
Identity/workplace correct	Named account and assigned plant	☐
Role is least privilege	Menu and access matrix reviewed	☐
Positive task works	Representative training record	☐
Negative access works	Unrelated screen/action denied	☐
Maker-checker understood	Observed hand-off	☐
Correction path understood	Cancellation/reversal exercise	☐
Security complete	2-step and recovery procedure	☐

Plain-language glossary

Action permission Allows a specific command such as Create, Approve, Post, Pay or Close.	Assignment Connects a user and role to one company/plant, optionally for a date range.	Context / workplace The company and plant currently selected in the top bar.
FEFO First-expire, first-out lot selection used to protect shelf life.	Maker-checker One person prepares; another authorised person approves or posts.	Permission A named authority used by the backend to allow a screen or action.
Role A reusable bundle of permissions representing a job responsibility.	Screen permission Allows a business screen to appear and its protected information to be read.	Version conflict The record changed after you opened it; refresh before deciding.

Best adoption habit
Ask "What happened in the business?" before choosing a system action. The correct ERP command should describe the real event and preserve its evidence.

Training environment and document control

Use these credentials only on the local development/UAT environment supplied with this project.

Local training accounts

ROLE	EMAIL
Sales Manager	demo.user@qtfoods.local
Operations Manager	operations.user@qtfoods.local
Finance Manager	finance.user@qtfoods.local
ERP Administrator	admin.user@qtfoods.local
Partner User	partner.user@qtfoods.local

Local password: prototype

These seeded credentials are development data. Never enable or reuse them in production.

Document control

Document	ERP Roles, Permissions & User Manual
Edition	UAT / training
Version	1.0
Snapshot date	15 September 2026
Permission source	Current seeded role/screen/action definitions
Screen source	Live local ERP at time of capture
Owner	To be assigned by Q & T Foods
Review trigger	Role, permission, screen or workflow change

Keep this manual aligned

When a role or workflow changes, update the source permission matrix, recapture affected screens, regenerate the PDF and record business-owner approval.
